

Smart waste management system using IOT

PROBLEM STATEMENT :-

Waste is an important issue, which needs to be tackled smartly. We got inspired from “Swatch Bharat Abhiyan” which is a national campaign by the Government of India, to clean the streets, roads and infrastructure of the country.

➤ The major objective of this proposed system is to stop the dustbin overflowing around the road side and localities as smart

bins are used in real time. This can create the surrounding area a neat and clean while eliminating the overflow of the wastage outside the dustbin due to regular cleaning of the dustbin. Our objectives for this project are as follows:

➤ Sensor based smart waste dustbin will judge the level of waste in it and send the message directly to the municipal corporation.

➤ According to the filled level of the smart waste dustbin, the vehicles from the municipal corporation will choose the shortest path which will save their time.

➤ It emphasizes on “Digital India” as

well as “Swatch Bharat Abhiyan”.

➤ The system is simple. If there is any problem with any equipment in the future, that part is easily replaceable with new one without any difficulty and delay

Discussing about the future scope in this project we can develop it as follows:

Discussing about the future scope in this project we can develop it as follows:

➤ In future, some additional features will add to this project to crush and recycling plastics and other materials automatically.

➤ We can develop the smart dustbin which will automatically separate trash into solid waste and liquid waste.

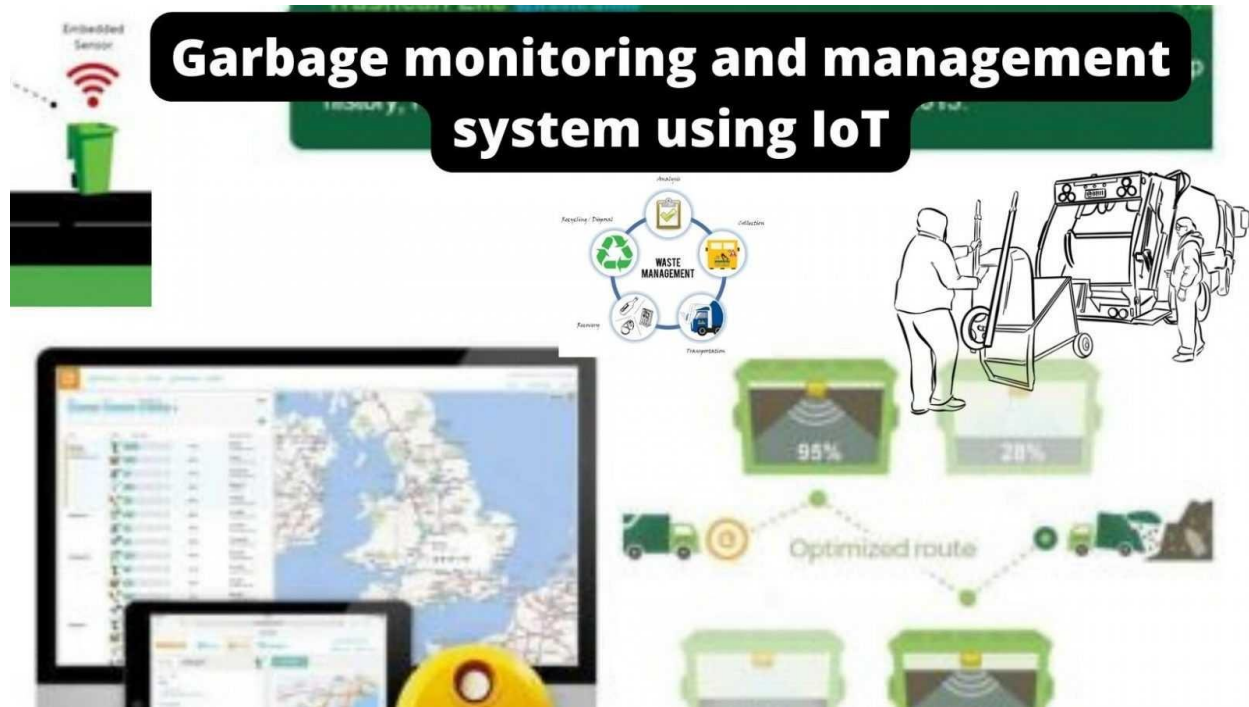

➤ For future, instead of person in the vehicle we can make use of a line

follower robot which does not require a man power to move the vehicle.

➤ This path follower robot is able to follow line marked on contrasting background usually black line on a white surface or white line on a black In future, some additional features will add to this project to crush and recycling plastics and other materials automatically.
